

## REDUCING FOOD WASTE IN THE SUPPLY **CHAIN: GREENHOUSE GAS BENEFITS**

Reducing crop and food waste is widely understood to have environmental and economic benefits. However, at different points along the supply chain, and for different approaches to reducing food waste, the benefits may be larger or smaller, or in some cases even negative. General life cycle assessment concepts will be explained with examples of the food supply chain and how it might change under a range of waste reduction scenarios. Examples of how to quantify and characterize the greenhouse gas benefits of reducing crop and food waste will be discussed, with suggestions for greater efficiency and improvement.
